CS-NRRM White Paper

A 12-Year Longitudinal Structural Observation Framework

1. Abstract

This document presents CS-NRRM (Changhun Shin Natural Recovery Pattern Model),
a non-medical structural observation framework derived from a 12-year (4,300-day) continuous dataset.

It focuses on how changes are structured over time, not on outcomes.

---

2. Dataset Integrity

- Duration: 12 years (4,300 days)
- Continuity: No missing intervals
- Structure: Time-indexed observational records
- Scope: Single-subject longitudinal archive

---

3. Structural Framework

CS-NRRM organizes data into:

Input -> Processing -> Output

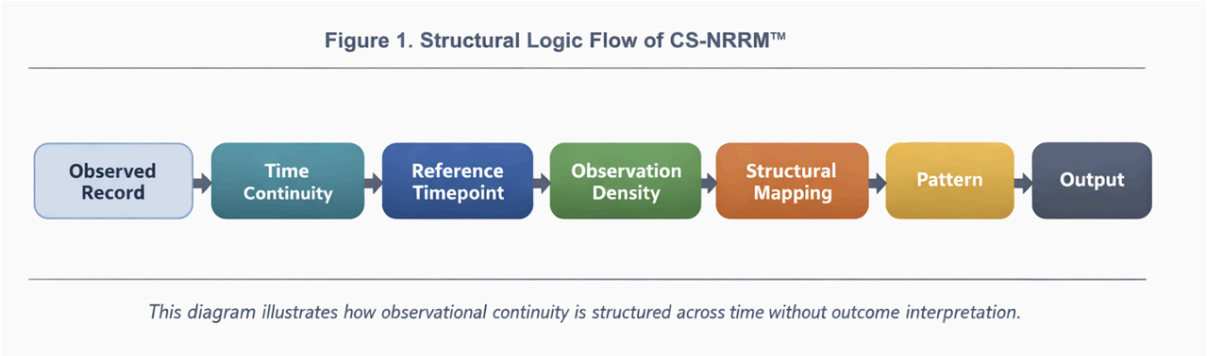

Figure 1. Structural Logic Flow of CS-NRRM™

This diagram illustrates how observational continuity is structured across time without outcome interpretation.

Input

- Time-indexed observational data
- Visual records

Processing

- Reference timepoint selection
- Observation density mapping
- Structural arrangement

Output

- Structural pattern visibility
- Continuity across time

---

4. Reproducibility

This framework allows observers to:

- Follow data arrangement
- Verify continuity
- Trace structural emergence

---

5. Implementation Perspective

The structure allows potential AI implementation.

It enables:

- Non-interpretive data structuring
- Time-based pattern representation

---

6. Boundary Conditions

- No diagnosis
- No treatment
- No prediction

---

7. Conclusion

This framework does not explain outcomes.
It describes how change is structured over time.

---
